To begin the implementation, I will need the following from your team:

API Endpoint URLs: The development URLs for the webhooks FreeSWITCH will call. Specifically:

The endpoint for SIP Authentication (e.g., https://api.dev.outdial.com/fs/auth).

The endpoint for the initial Dialplan lookup.

The endpoint for in-call Call Control.

Server Access: Access credentials to a development server (Linux/Debian preferred) where I can install and configure FreeSWITCH. If you prefer, I can set one up and you can point a DNS subdomain (e.g., fs-dev.outdial.com) to it.

A Sample JWT: A sample, valid JWT that I can use during development to test the authentication flow against your endpoint.

Once I have these items, I can begin the core setup and configuration.
